physics.

centre of gravity is assumed. Isolated system

Assume mass = 100 kg.  
80 for person 20 for board  
 $g = 9.8 \text{ m.s}^{-2}$

Thrust = ~~20~~ 980 N + ...

gravity = force exerted by Earth on hover board.  $F = mg \therefore F = 100 \times 9.8 = 980 \text{ N}$

hover Thrust = 980 N (kg.s<sup>-2</sup>);  $a = 0$ .

It should hover 0.5 m off the ground.

$\therefore E_k = 0$ .  $E_p = mgh$ .

$\therefore E_p = (100)(9.8)(0.5)$   
 $= 490 \text{ J}$ .

$F = ma$ . then acc to specific height.

See Aerodynamics.
